WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases admitted to a medical installation (either to hospital or quarters) and not returned to duty within the same day, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all "new" traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, as well as various types of wounds not due to enemy action) other than battle casualties. Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. It may be noted that under the term infectious hepatitis are included cases reported as jaundice and cholangitis. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. More significant is the estimated non-effective rate for personnel stationed in the United States shown in the chart on page 7.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

In making comparisons between Service Commands it should be borne in mind that morbidity rates naturally tend to be higher in those Service Commands which have a relatively large number of General Hospitals and Ports of Embarkation. The presence of sizeable numbers of troops not under the jurisdiction of a Service Command (e.g. casualties, task force troops, etc.) affects the interpretation of the data from the viewpoint of Command responsibility.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table. It should also be noted that reception, redistribution, and separation centers frequently report relatively large numbers of admissions arising from routine physical examinations of large bodies of troops.

EXPLANATORY MATTER

In reading the detail tables, it should be born in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

Morbidity from all causes decreased slightly during the week ending 16 February 1945, being reported at a rate of 675 per year per thousand strength. This rate is quite close to the average which has prevailed since the middle of January. The current week's morbidity is about 15 percent below that for the corresponding week of 1944, due almost entirely to lower morbidity from colds, influenza, etc.

Morbidity from disease also decreased slightly to 625 per thousand which is the second highest rate reported during this year.

The admission rate from injury decreased somewhat to 50 per thousand, which is believed to be the lowest rate ever reported for this cause. However, it should be borne in mind that the injury rates reported since October 1944 are not strictly comparable with those prior to that time, because of the directive (issued 29 September 1944) which provided for the reporting of injuries existing prior to entry into active service and readmissions for injury under "disease" rather than under "injury," as was formerly done.

Respiratory Causes:

Morbidity from colds, influenza, etc. decreased by a small amount for the second consecutive week, being reported at 191 per thousand for the current week. This rate is about 30 percent lower than that for the corresponding week of 1944.

The admission rate for pneumonia increased to 16 per thousand which is the highest reported since the middle of March 1944. Nonetheless, the rate for the current week is about 10 percent lower than for the

corresponding week of 1944.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding cases contracted prior to entry on active service, continued unchanged at 43 per thousand. Although this rate is considerably below the peak rate of 1945 (49 per thousand for the second week of January), it is, nevertheless, above the highest rate of 1944.

The admission rate for diarrhea and dysentery was again reported at 8 per thousand which is about the same level as experienced during the corresponding week of 1944.

The number of new cases of measles decreased somewhat for the second consecutive week but was nevertheless almost twice the average weekly number reported during January. The number of new cases of mumps increased about 10 percent and was the highest number reported during any week since June 1944. The number of new cases of scarlet fever also increased about 10 percent during the current week and was at a level about twice as high as the weekly average during January. The number of new cases of meningitis and rheumatic fever were at about the same level as the weekly average for the year to date.

VARIATION IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

The admission rates for diseases showed relatively minor fluctuations in most Service Commands. The Second Fourth, and Sixth Service Commands and the Military District of Washington were the only Commands to report decreases in morbidity from disease of more than 5 percent, while an increase of similar magnitude occurred only in the Fifth Service Command.

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS (CONT'D)

The Third Service Command reported the highest morbidity from all causes (753 per thousand) and from disease (712 per thousand), closely followed by the First, Second, and Fifth Service Commands. The lowest morbidity from all causes (607 per thousand) and from disease (567 per thousand) was again reported by the Seventh Service Command.

Morbidity from injury decreased sharply in the First Service Command and the Military District of Washington, while increases were reported only by the Fifth and Ninth Service Commands. The Fourth and Ninth Service Commands experienced the highest morbidity from this cause (about 57 per thousand), while the Sixth Service Command and the Military District of Washington had the lowest admission rate (about 32 per thousand).

Respiratory Causes:

Morbidity from colds, influenza, etc. decreased in all Service Commands except the Second, Fifth, and Eighth for which only moderate increases were reported. No Service Command experienced a decline of more than 10 percent in the admission rate from these causes. The Fifth Service Command with a rate of 242 per thousand reported the highest morbidity, while the Seventh and Ninth Service Commands registered the most favorable experience (about 160 per thousand).

The admission rates from pneumonia increased in all Service Commands except the Military District of Washington. However, only in the Fifth Service Command was there a sharp rise. The highest morbidity from this cause was reported by the Fourth, Fifth, Sixth, and Eighth Service Commands all of which had rates of about 20 per thousand.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding EPTS

cases, decreased sharply in the First, Second, and Third Service Commands with only the Eighth and Ninth Service Commands reporting significant increases. The highest morbidity from these causes was reported by the Second Service Command (56 per thousand); the high experience in this Command is due largely to the presence of task force troops not under its jurisdiction.

A notable increase in morbidity from diarrhea and dysentery occurred in the Fifth Service Command which was the only Command with a rate in excess of 10 per thousand; this rise was accounted for entirely by an outbreak at Fort Knox, Ky.

NON-EFFECTIVE RATE:

The non-effective rate for personnel stationed in the continental United States is estimated at 35.8 per thousand strength for the week ending 16 February as compared with approximately 38 per thousand for the corresponding week of 1944. The mean number of non-effectives in this country, including evacuees from overseas, rose to 78.0 per thousand.

PATIENTS REMAINING UNDER TREATMENT: 16 February 1945:

The number of neuropsychiatric cases remaining was 31,067 or about 300 more than at the end of the previous week. Non-battle injury patients remaining numbered 34,300. The number of battle casualty patients remaining increased by about 1,300 to number 54,478.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 16 February there were 4,036 enlisted men discharged by CDD or about 250 more than the previous week. About 61 percent of these discharges were reported by General Hospitals. Included among the 4,036 CDD's were 1,823 neuropsychiatric cases.

COMMENT ON RECENT DEVELOPMENTS

FOR THE FOUR WEEK PERIOD ENDING 26 JANUARY 1945

NATURE OF THE DATA:

The data of this Monthly Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the four week period ending 26 January 1945 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This Report covers morbidity and mortality data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal diseases and for neuropsychiatric cases.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 27. Similar charts for specified diseases appear on pages 29, 31, and 33. A chart showing mortality trends is presented on page 35. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 36. The most pertinent morbidity data for individual stations are presented on pages 37 to 62. On pages 63 and 64 the seven stations with the highest rates of admission during the month are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates

based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates and the discussion of the proportion of total Army strength included in the stations covered by this Report as given on page 2. The term "month" in this report is used to denote the four or five week period based on the number of Fridays in the calendar month.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

Admission rates from all causes and from disease for the Army in the continental United States increased almost 20 percent in January. The Navy shore stations in this country likewise reported a relatively sharp increase in morbidity in January as compared with December. The Army's morbidity from disease during January (603 per year per thousand strength) was the highest reported since March 1944 but nevertheless was more than 20 percent lower than the rate for January 1944. All of the excess morbidity during January 1944 as compared with January 1945 was due to higher admission rates for respiratory causes.

The admission rate from injury remained at 55 per thousand, which is the lowest rate on record; however, the recent experience is not strictly comparable with that prior to October 1944 because the relatively low level of injuries since that time reflects in part at least compliance with the directive issued 29 September 1944 which required readmitted and EPTS injuries to be reported as "disease" and not as "injury."

Higher morbidity from disease during January as

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

compared with December was reported by every Service Command except the Second, which reported only a slight decrease. Increases of 20 percent or more were reported by the First, Fifth, Sixth, and Eighth Service Commands and the Military District of Washington.

The Third Service Command reported the highest morbidity from all causes and from disease in January (both being about 20 percent higher than for the country as a whole), closely followed by the Sixth Service Command. The lowest admission rates from all causes and from disease were registered in the Seventh Service Command (both about 10 percent under the rates for the country as a whole), closely followed by the Fourth, Eighth, and Ninth Service Commands.

The highest morbidity from injury during January was reported by the Fourth and Eighth Service Commands (61 per thousand). The lowest admission rates from injury were reported in the Sixth Service Command and the Military District of Washington, both with rates of about 40 per thousand.

RESPIRATORY DISEASES:

During January the admission rate from colds, influenza, etc. rose more than 40 percent to 167 per thousand, which is the highest rate reported since March 1944. Morbidity from respiratory diseases also increased sharply at shore stations of the Navy in this country, which reported a rate in excess of 200 per thousand in January. The Army's admission rate for January 1945 was about 50 percent below that for January 1944, during which month a notable outbreak of common respiratory infections was waning.

Morbidity from colds, influenza, etc. increased significantly in all Service Commands. Increases of 50 percent or more were reported by the Fourth, Fifth, and Eighth Service Commands. The Fifth and Sixth

Service Commands reported the highest morbidity from these causes (about 238 per thousand), followed by the Eighth Service Command and the Military District of Washington (about 190 per thousand). The lowest rate occurred in the Seventh Service Command (128 per thousand), followed by the Fourth Service Command (147 per thousand).

Morbidity from all forms of pneumonia combined increased by about 10 percent in January. Nonetheless, the admission rate for January 1945 was almost 50 percent lower than during January 1944.

Morbidity from pneumonia was higher in January in every Service Command except the Military District of Washington where a slight decrease was registered. The Sixth Service Command again experienced by far the highest admission rate from this cause; the January rate for this Command was almost 50 percent higher than the December rate for this Command and more than double the January rate for the country as a whole.

In January atypical pneumonia accounted for slightly more than two-thirds of all pneumonia admissions. The proportion of pneumonia cases diagnosed as atypical was highest in the Fourth, Sixth, Eighth, and Ninth Service Commands in all of which it exceeded 70 percent.

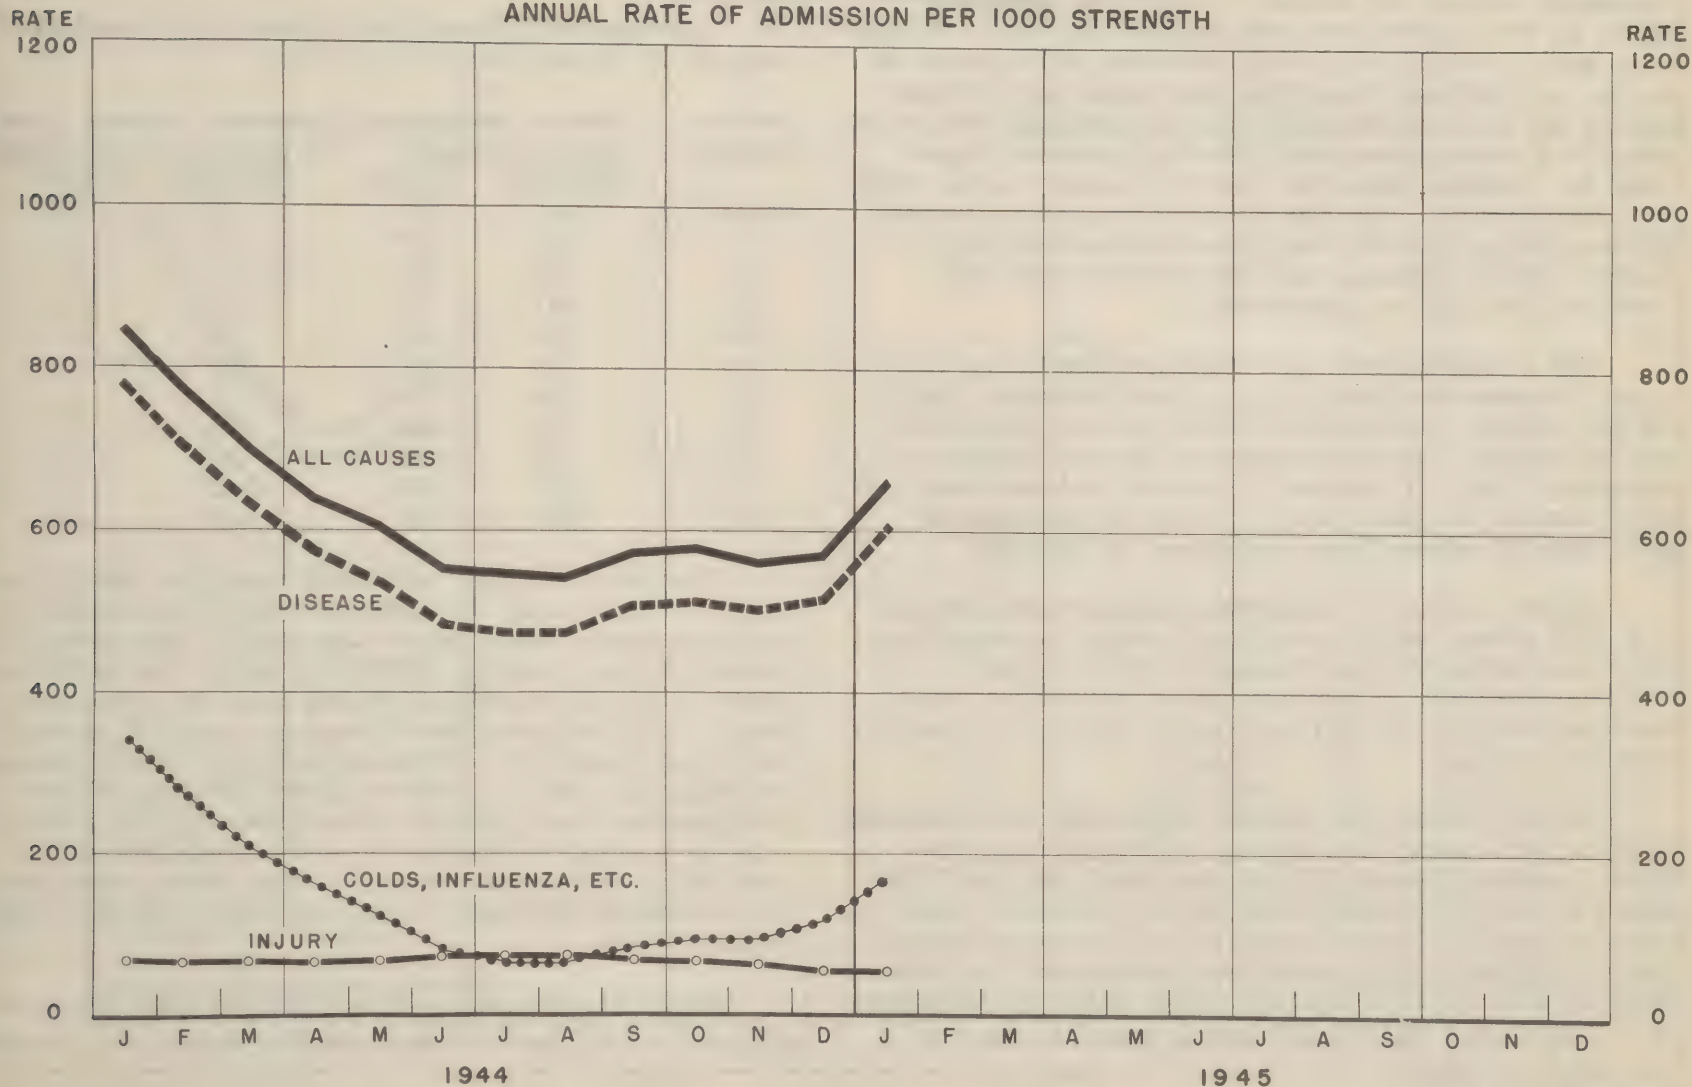

DIARRHEA AND DYSENTERY:

Morbidity from diarrhea and dysentery remained at substantially the same level in January as in the previous two months. The admission rate for January 1945 was about 15 percent lower than that for January 1944. The Eighth Service Command, with a rate of 10 per thousand was the only Command to register morbidity from this cause materially in excess of the average for the country as a whole.

MORBIDITY FROM — ALL CAUSES — DISEASE

— INJURY — COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES
ANNUAL RATE OF ADMISSION PER 1000 STRENGTH

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

VENEREAL DISEASES:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, increased sharply in January to 46.7 per thousand, which is the highest rate reported in any month during this war. Part of this sharp increase is believed to be due to a delayed reporting and discovery of cases during the holiday season. The January 1945 admission rate from these causes was almost 20 percent higher than for December 1944 and over 50 percent higher than for January 1944. The Navy's morbidity from venereal disease during January was likewise considerably higher than in December and was at about the same level as the Army's experience.

The admission rate for syphilis, excluding EPTS cases, increased slightly to 4.5 per thousand, which is the highest rate reported since January 1944 (4.7 per thousand). The major portion of the increase in morbidity from all venereal diseases combined was attributable to gonorrhea, for which an increase of more than 20 percent was registered in January.

Higher morbidity from venereal diseases, excluding EPTS cases, was reported in January by every Service Command except the Second in which a small decrease occurred. Increases of 25 percent or more were reported by the First, Fourth, Sixth, and Seventh Service Commands.

During January the highest morbidity from venereal disease, excluding EPTS cases, was reported by the First Service Command (69 per thousand), closely followed by the Third and Fifth Service Commands (about 63 per thousand). The First and Third Service Commands had a relatively high experience because of the presence of task force troops not under their jurisdiction. Only the Eighth and Ninth Service Commands and the

Military District of Washington registered admission rates from these causes of less than 40 per thousand.

The venereal disease cases remaining under treatment on 26 January are shown below:

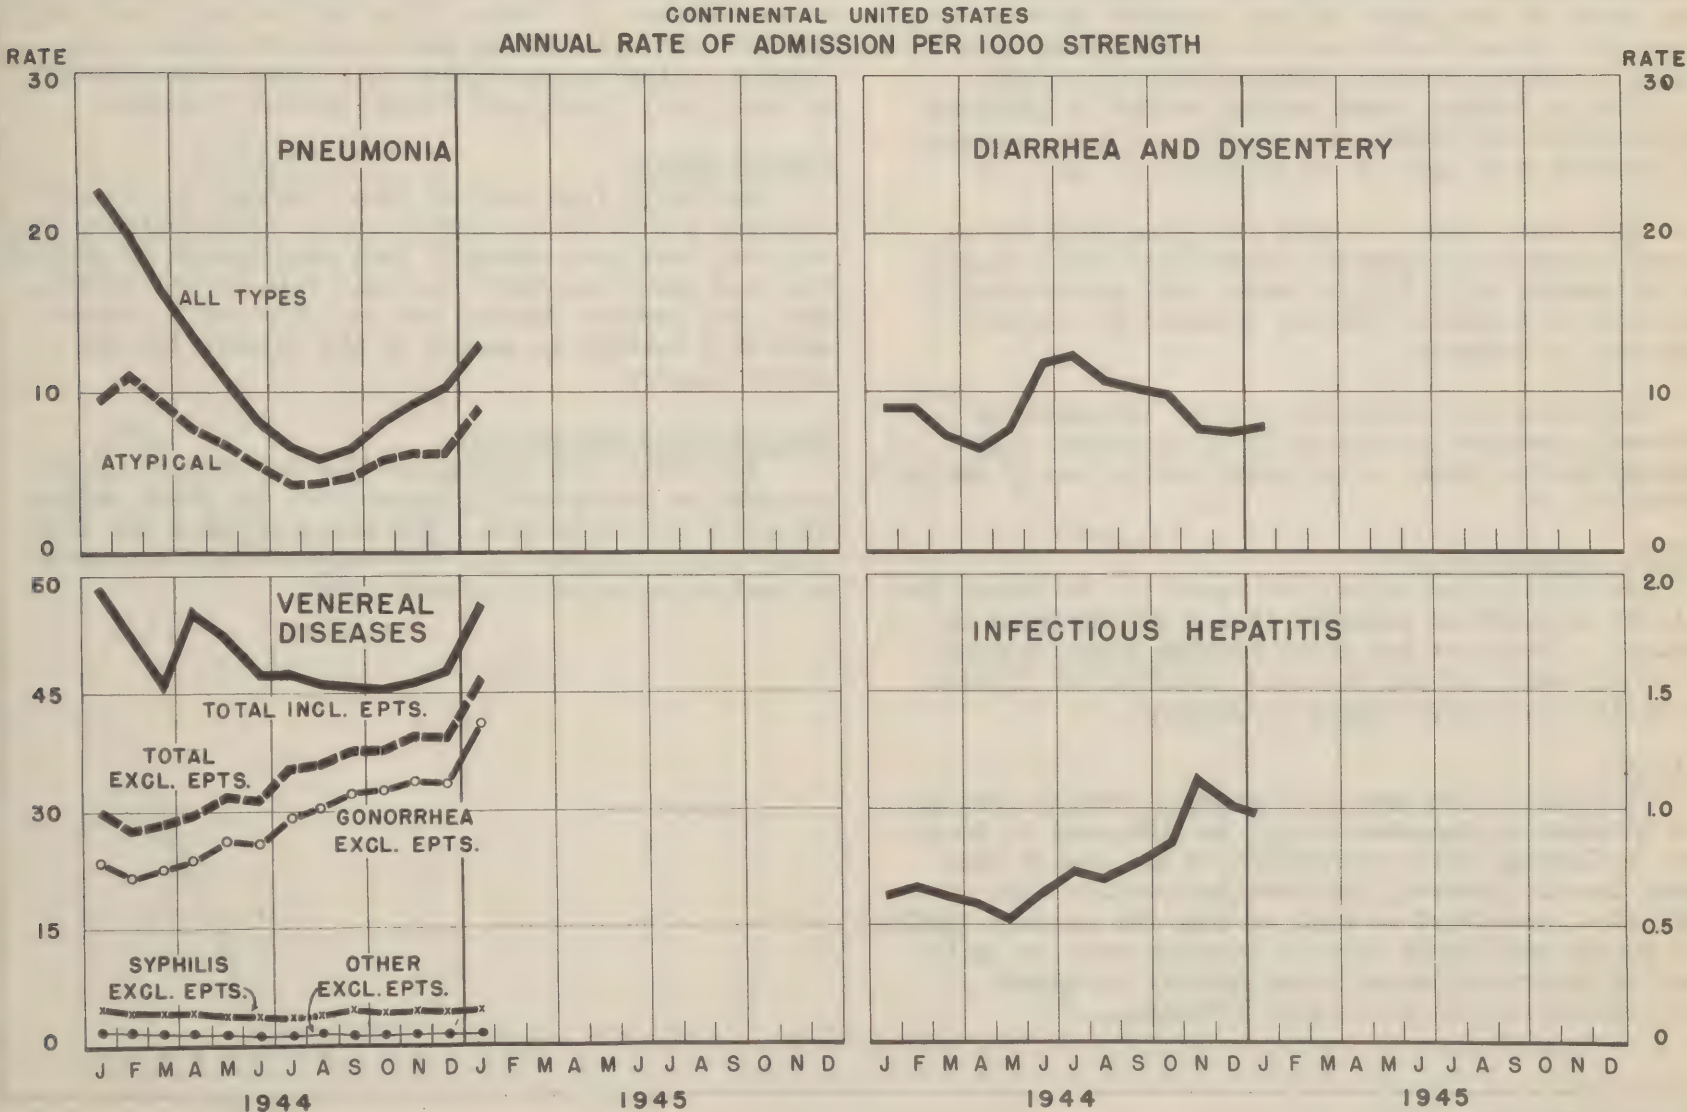

Service Command	Number Remaining Under Treatment		Venereal Disease Cases as Percent of all Cases	
	Syphilis	Other	Syphilis	Other
TOTAL U.S.	1666	883	.80	.42
I	53	27	.7	.4
II	48	105	.2	.5
III	307	84	2.4	.7
MDW	15	23	.4	.6
IV	392	161	.9	.4
V	54	75	.3	.3
VI	28	44	.2	.4
VII	93	41	.6	.2
VIII	455	202	1.1	.5
IX	221	121	.7	.4

The great bulk of the cases remaining were contracted after entry on active service. The number of syphilis cases remaining at the end of January was 18 percent higher than for December, while the number of cases of other venereal diseases remained about the same. Total venereal cases represented 1.22 percent of the total number of patients remaining under treatment in hospital. The very much longer duration of hospitalization for syphilis is indicated by the fact that only 10 percent of the total venereal admissions (excluding EPTS cases) were for this cause, even though 65 percent of the cases remaining under treatment were syphilis cases.

Morbidity represented by venereal EPTS cases was reported at 9.7 per thousand during January as compared

MORBIDITY FROM—PNEUMONIA—DIARRHEA AND DYSENTERY

VENEREAL DISEASES—INFECTIOUS HEPATITIS

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

with 8.4 per thousand for December. The admission rate from this cause has in general been decreasing steadily during recent months as a result of the downward trend in the number of men inducted into the Army. Variations in the admission rate for venereal EPTS cases as between Service Commands have relatively little significance, because they reflect a different geographical and racial distribution of Army personnel as compared with that of new inductees.

The total number of days lost from duty during January because of venereal disease was about 70,000 or an average of 17,500 per week; this represented a non-effective rate of .82 per thousand as compared with .78 in December.

Detailed data as to the January incidence of venereal diseases by color will be presented in a Special Health Report to be contained in Weekly Health Report No. 8.

INFECTIOUS HEPATITIS:

Morbidity from infectious hepatitis decreased from 1.1 per thousand in December to 1.0 per thousand in January. The First and Fifth Service Commands with rates of about 1.8 per thousand reported the highest morbidity from these causes in January.

MEASLES:

Morbidity from measles increased sharply from .4 per thousand in December to 1.3 per thousand in January, reflecting the continuation of the upward seasonal trend. However, the rate for January 1945 is only about one-third as high as that for January 1944. The Fourth and Eighth Service Commands were the only ones to report admission rates notably in excess of the average for the country as a whole.

MUMPS:

Morbidity from mumps doubled in January to reach 5.7 per thousand. This rate is about 40 percent in excess of that for January 1944 but is only about half the peak rate reached in March and April 1944. The highest admission rates from this cause were reported by the First, Third, and Fourth Service Commands.

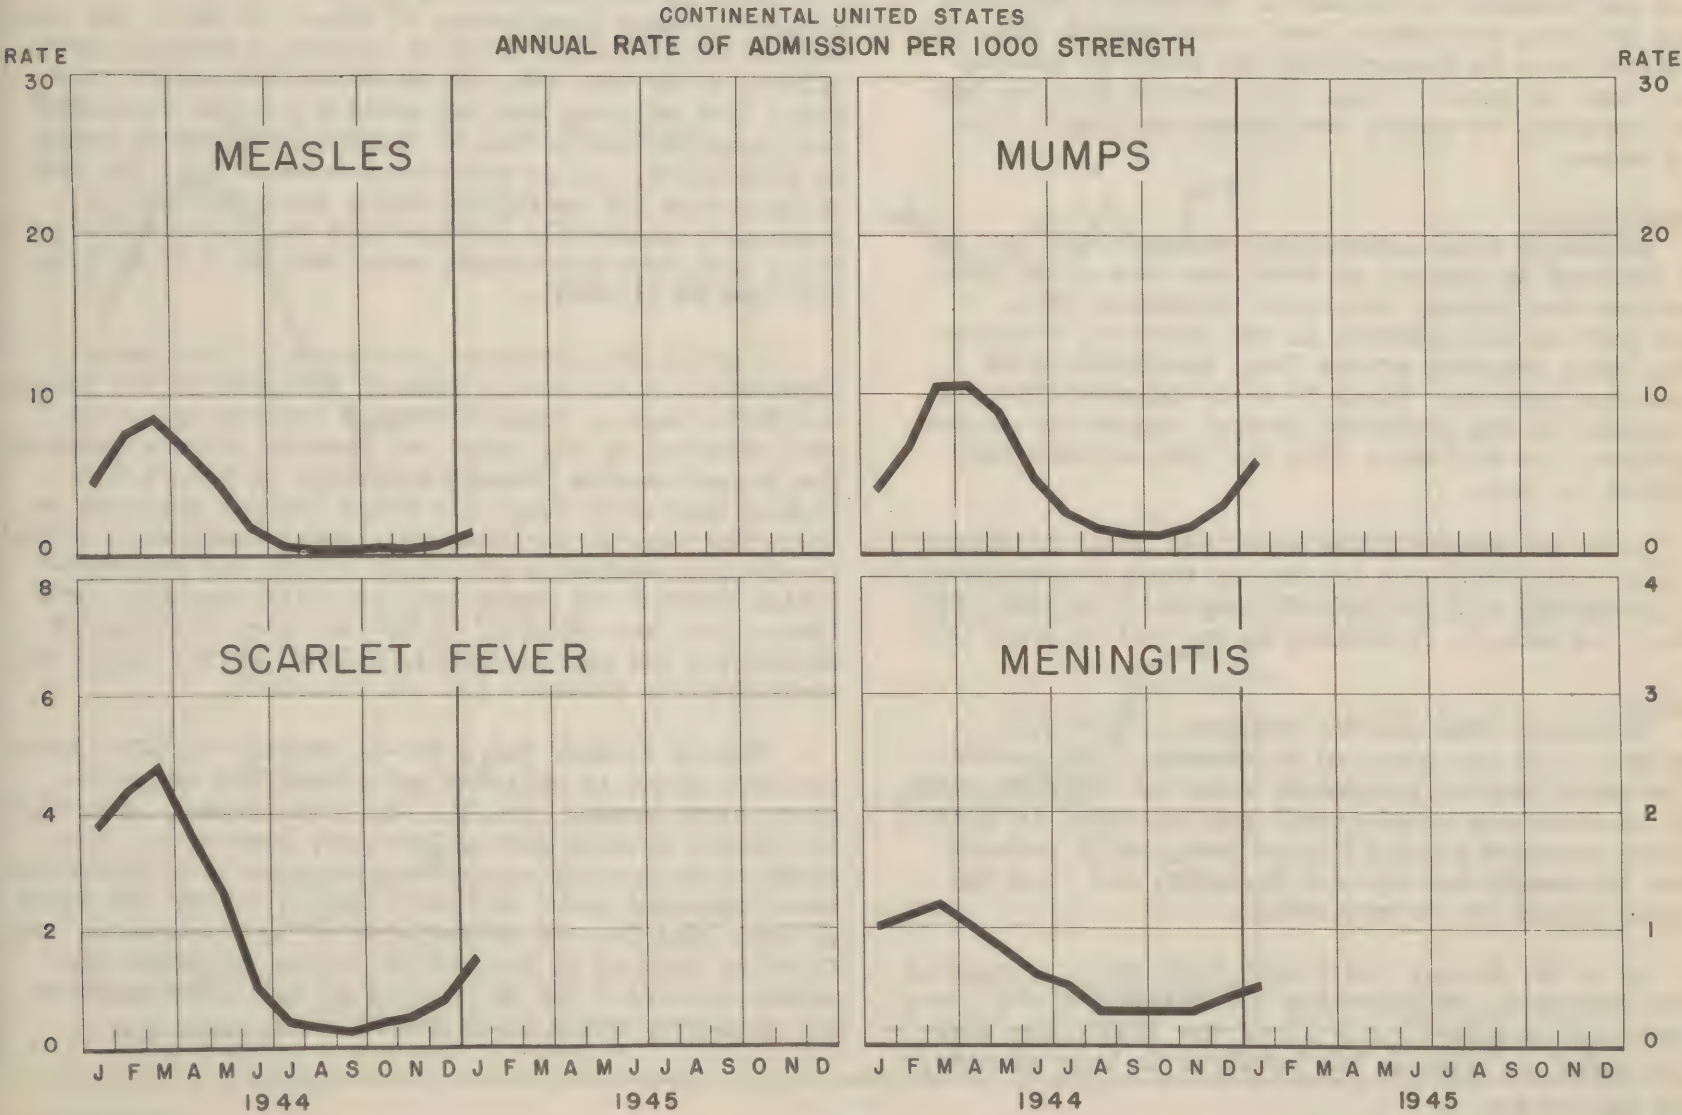

SCARLET FEVER:

Morbidity from scarlet fever doubled in January reaching a rate of 1.5 per thousand. Nonetheless, this rate was less than one-half that experienced in January 1944 and about one-third the peak rate of March 1944. The Sixth Service Command was the only one to report morbidity notably in excess of the average for the entire country.

MENINGOCOCCIC MENINGITIS:

Morbidity from meningitis was reported at .5 per thousand or fractionally higher than the level during the previous six months. The admission rate for this cause during January 1945 was only one-half as great as that experienced in January 1944.

MORBIDITY FROM ————— MEASLES ————— MUMPS
SCARLET FEVER ————— MENINGITIS

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

RHEUMATIC FEVER:

Morbidity from rheumatic fever was reported at .8 per thousand in January as compared with a revised rate of .8 per thousand in December. Morbidity from this cause has been relatively level since August 1944. The admission rate in January 1945 was about 40 percent lower than in January 1944. The Seventh Service Command continued to report the highest morbidity from this cause.

TUBERCULOSIS:

Morbidity from tuberculosis was reported at 1.1 per thousand in January or about the same as in December and the highest rate since September 1943. A large part of the increase in the number of tuberculosis cases reported arises from examinations at Separation Centers. It is to be anticipated that as the number of men processed through separation centers increases, the admission rate for tuberculosis will continue to rise.

As of 26 January there were 1555 cases of tuberculosis remaining under treatment; these represented .75 percent of all patients in hospital. Of the 1555 cases, 564 were at Fitzsimons GH and 619 at Bruns GH.

MALARIA:

Morbidity from malaria acquired in the U.S. remained at .1 per thousand in January. The number of cases of malaria presumably acquired overseas which were admitted (or re-admitted) for treatment in this country averaged about 1320 per week, or 35 percent above the weekly average for December, and thus the highest figure so far recorded.

As of 26 January there were 3333 cases of malaria under treatment, representing 1.6 percent of all patients in hospital; only 11 of the 3333 cases were those where the disease was acquired in this country.

NEUROPSYCHIATRIC DISORDERS:

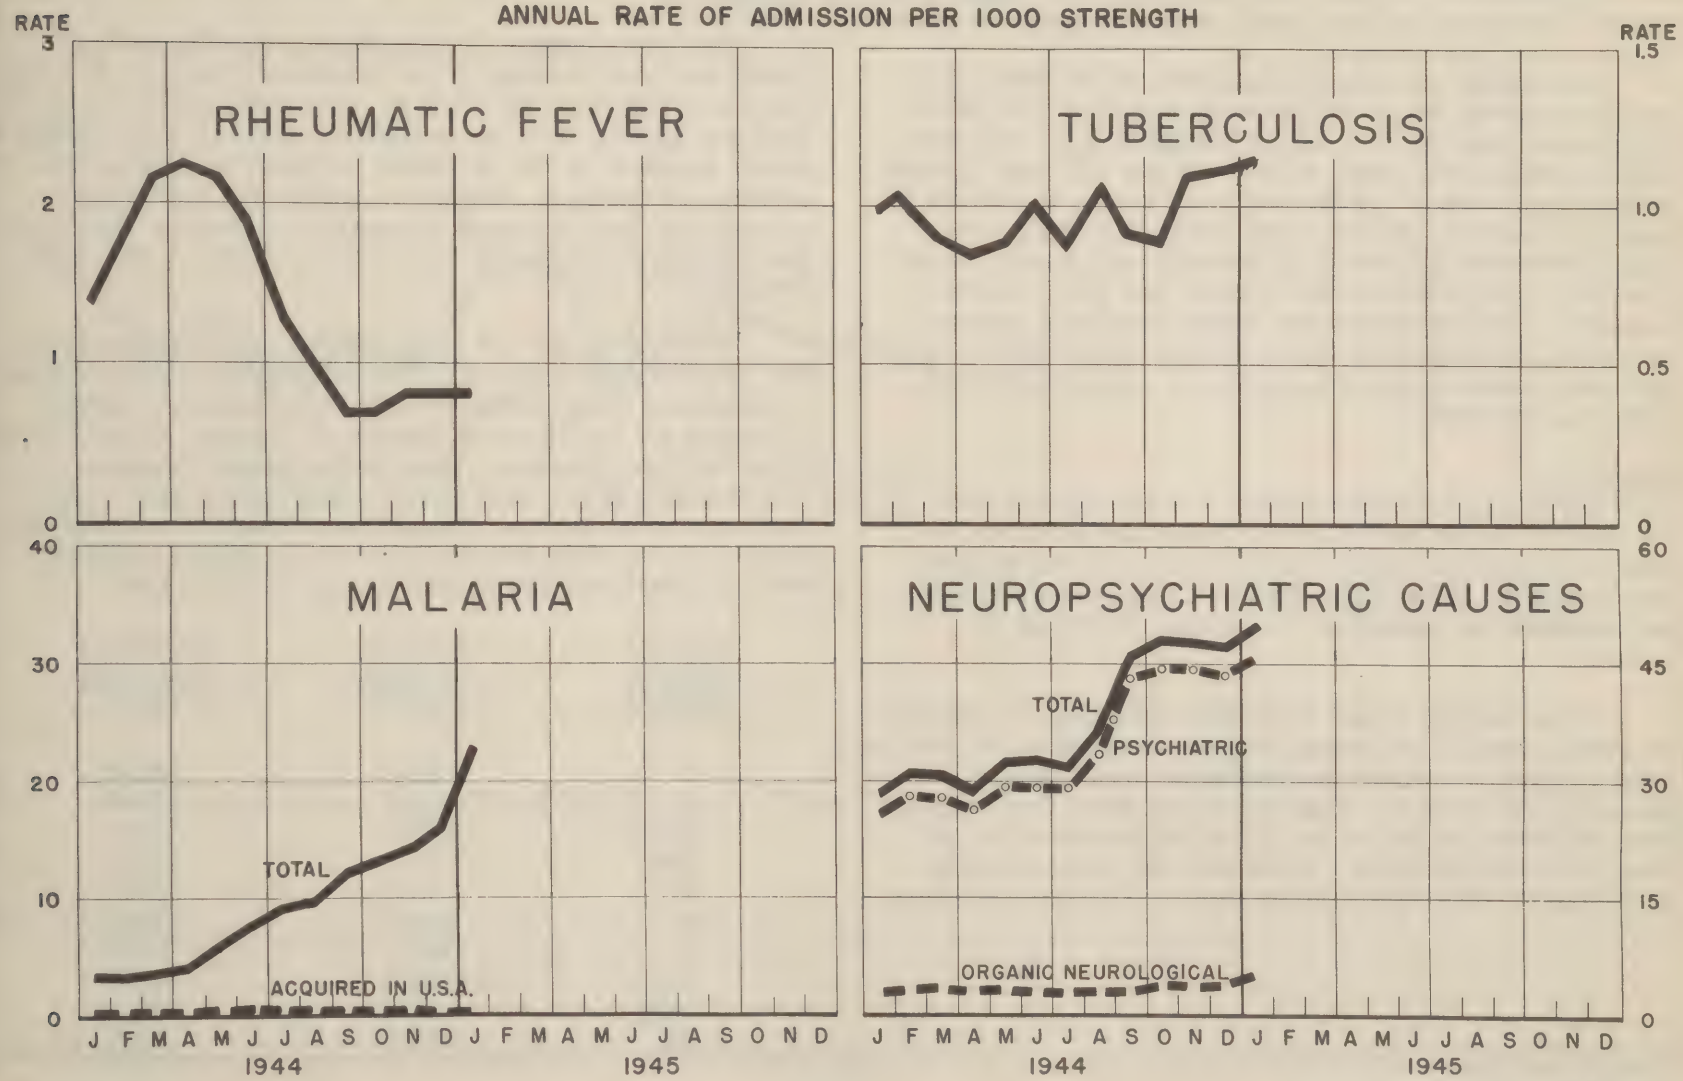

The annual rate of admission for neuropsychiatric disorders increased in January to 49.8 per thousand; this rate is slightly higher than that prevailing during the last four months of 1944. In part, the current relatively high level of admission reflects the effects of WD Cir. 370, 12 September 1944 which provided that enlisted men not meeting minimum standards for induction and having no suitable assignment could be discharged. It is noteworthy however that the rate of discharge for neuropsychiatric disorders had not increased, apparently because most mild psychiatric cases have been discharged under Section X of AR 615-360 (now AR 615-365).

Significant increases in morbidity from neuropsychiatric disorders in January occurred in the Fourth and Fifth Service Commands, while notable decreases were reported by the Third and Seventh Service Commands. The Second Service Command continued to report the highest morbidity from this cause (86 per thousand or about the same as in December) largely because of relatively high admission at Atlantic City AAF Redistribution Station and at several general hospitals. The lowest rate was reported by the Military District of Washington (24 per thousand), followed by the Sixth and Ninth Service Commands (35 per thousand).

During January there was an average of 1270 CDD's per week given to enlisted men classified as neuropsychiatric cases. This is about 20 percent lower than the weekly average during December; however as indicated above many neuropsychiatric cases have apparently been separated under the provision of WD Cir 370 dated 12 Sept 1944 for the convenience of the government. The CDD's in January in respect to neuropsychiatric disorders accounted for 38 percent of all CDD's or about the same proportion as in December.

MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

CONTINENTAL UNITED STATES
ANNUAL RATE OF ADMISSION PER 1000 STRENGTH

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

In January organic neurological cases accounted for 8 percent of all neuropsychiatric cases. Only in the Fifth, Sixth, and Seventh Service Commands did the proportion of organic neuropsychiatric cases exceed 10 percent of the total neuropsychiatric cases.

The number of neuropsychiatric cases remaining under treatment as of 26 January was 28,199 or about 5,300 more than at the end of December and thus the highest number reported so far during the war. During January the number of locked ward cases decreased by about 10 percent, whereas the number of open ward cases increased by about 40 percent with most of the rise being reported in the Second and Fifth Service Commands. Neuropsychiatric cases remaining represented 13.5 percent of all patients in hospital, with open ward cases being 10.4 percent and locked ward cases 3.1 percent.

MORTALITY:

Mortality from all causes during January was reported at 2.52 per year per thousand strength or about the same as during the previous three months. The mortality rate from disease increased from .59 per thousand in December to .65 per thousand in January.

It should be noted that the reporting of deaths on Forms 86ab is not complete, particularly for deaths from injury for which the understatement may be as great as 15 percent. The mortality rate from injury when adjusted to allow for this under-reporting is about 2.1 per thousand, resulting in an estimated total death rate from all causes of 2.7 per thousand.

NON-EFFECTIVE RATE:

The non-effective rate for Army personnel stationed in this country was about 35 per thousand in January as compared with 34 per thousand in December.

The mean number of non-effectives (including evacuees from overseas) per thousand strength for January was reported at 66.3 per thousand strength or 20 percent higher than in December; most of this increase arose because of an increase in hospital population at General Hospitals. The mean number of injury non-effectives per thousand strength in January was 12.6 per thousand, which is much higher than in previous months.

Variations in the mean number of non-effectives per thousand strength by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General Hospitals in each Service Command. When comparisons are made between the rates excluding General Hospitals, the variations by Service Command are seen to be very much smaller than when the days lost in General Hospitals are included, as evidenced in the table below:

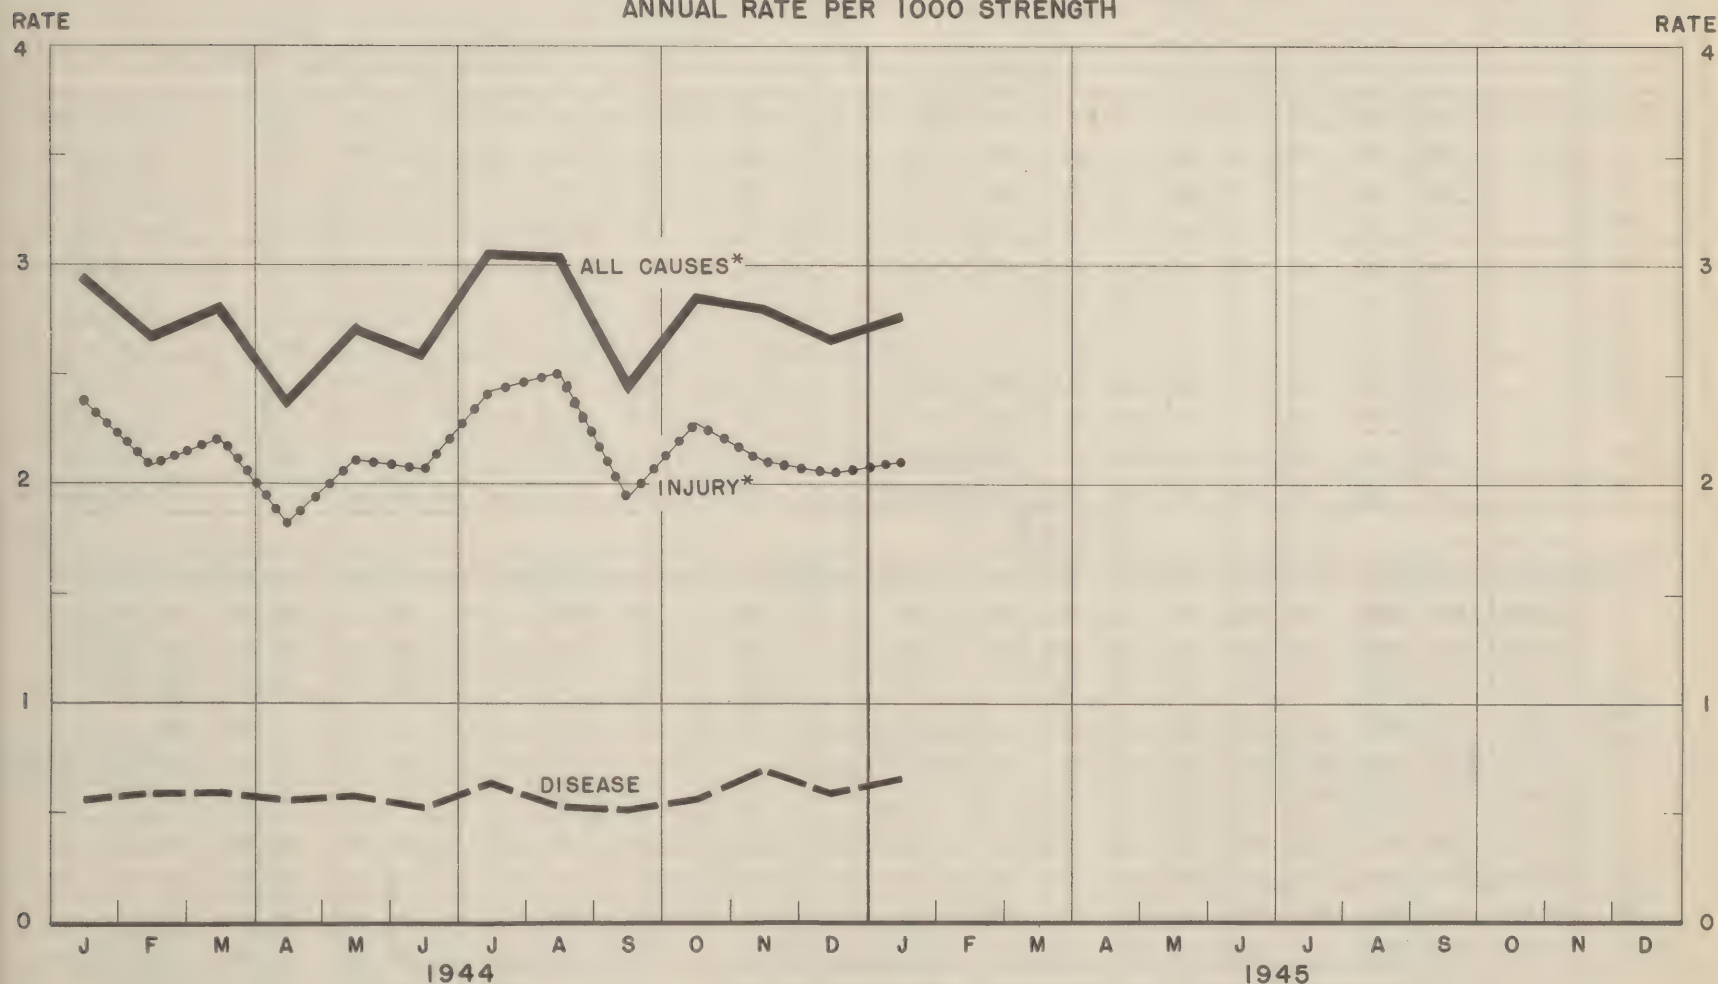

<u>Service Command</u>	<u>Including Gen. Hosp.</u>	<u>Excluding Gen. Hosp.</u>
TOTAL U.S.	66.3	29.0
I	85.3	26.8
II	94.9	30.8
